

EUCAMPTODON INFLATUSB. Wormald

Eucamptodon inflatus - an attractive, endemic, terrestrial moss found mostly in the Auckland Province. I first discovered it at Paremoremo near Albany, and on a trip to Moehau on the Coromandel Peninsula a few years ago, saw great masses of it on open and swampy ground on the flat area just below the summit. It also grows on Rangitoto. Though rare in the South Island it has been collected in the region of Lake Manapouri.
